

# National *Haemaphysalis longicornis* (Asian longhorned tick) Situation Report

As of April 2, 2025

*Haemaphysalis longicornis* (Asian longhorned tick), an exotic East Asian tick, has never previously established a population in the United States. It is a known serious pest of livestock in the Australasian and Western Pacific Regions where it occurs. It is an aggressive biter and frequently builds intense infestations on domestic hosts causing great stress, reduced growth and production, and severe blood loss.

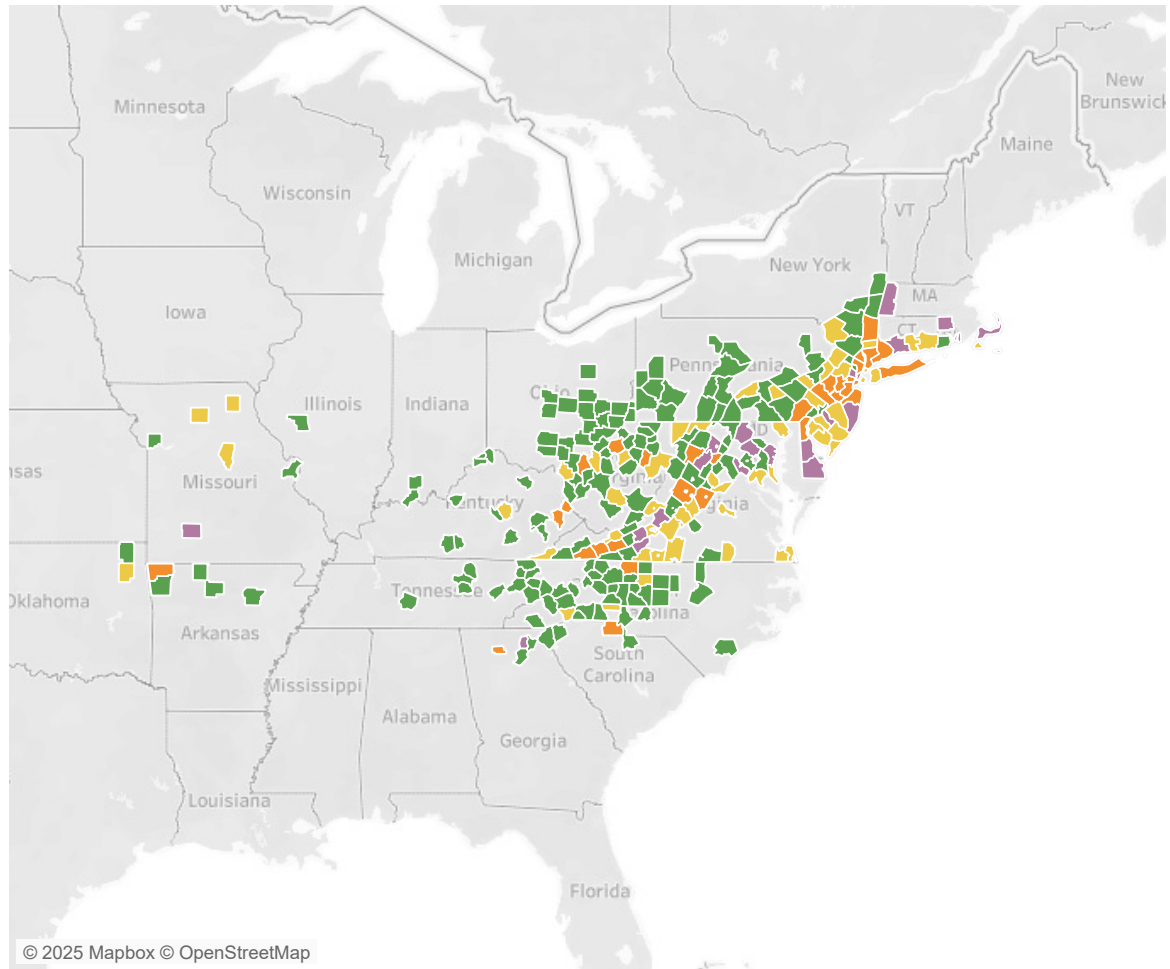

The tick can reproduce parthenogenetically (without a male); as such, a single fed female tick can create a population. It is also a known/suspected vector of several viral, bacterial, and protozoan agents of livestock and human diseases. This three-host tick can spread pathogens among a diverse host range, on which it feeds side-by-side with other tick species. The detections detailed here are the first reports of this tick out of quarantine in the United States.

## States with confirmed local Asian longhorned tick populations with number of counties in each state. (# of confirmed counties / total # of counties)

### Type of identification\*

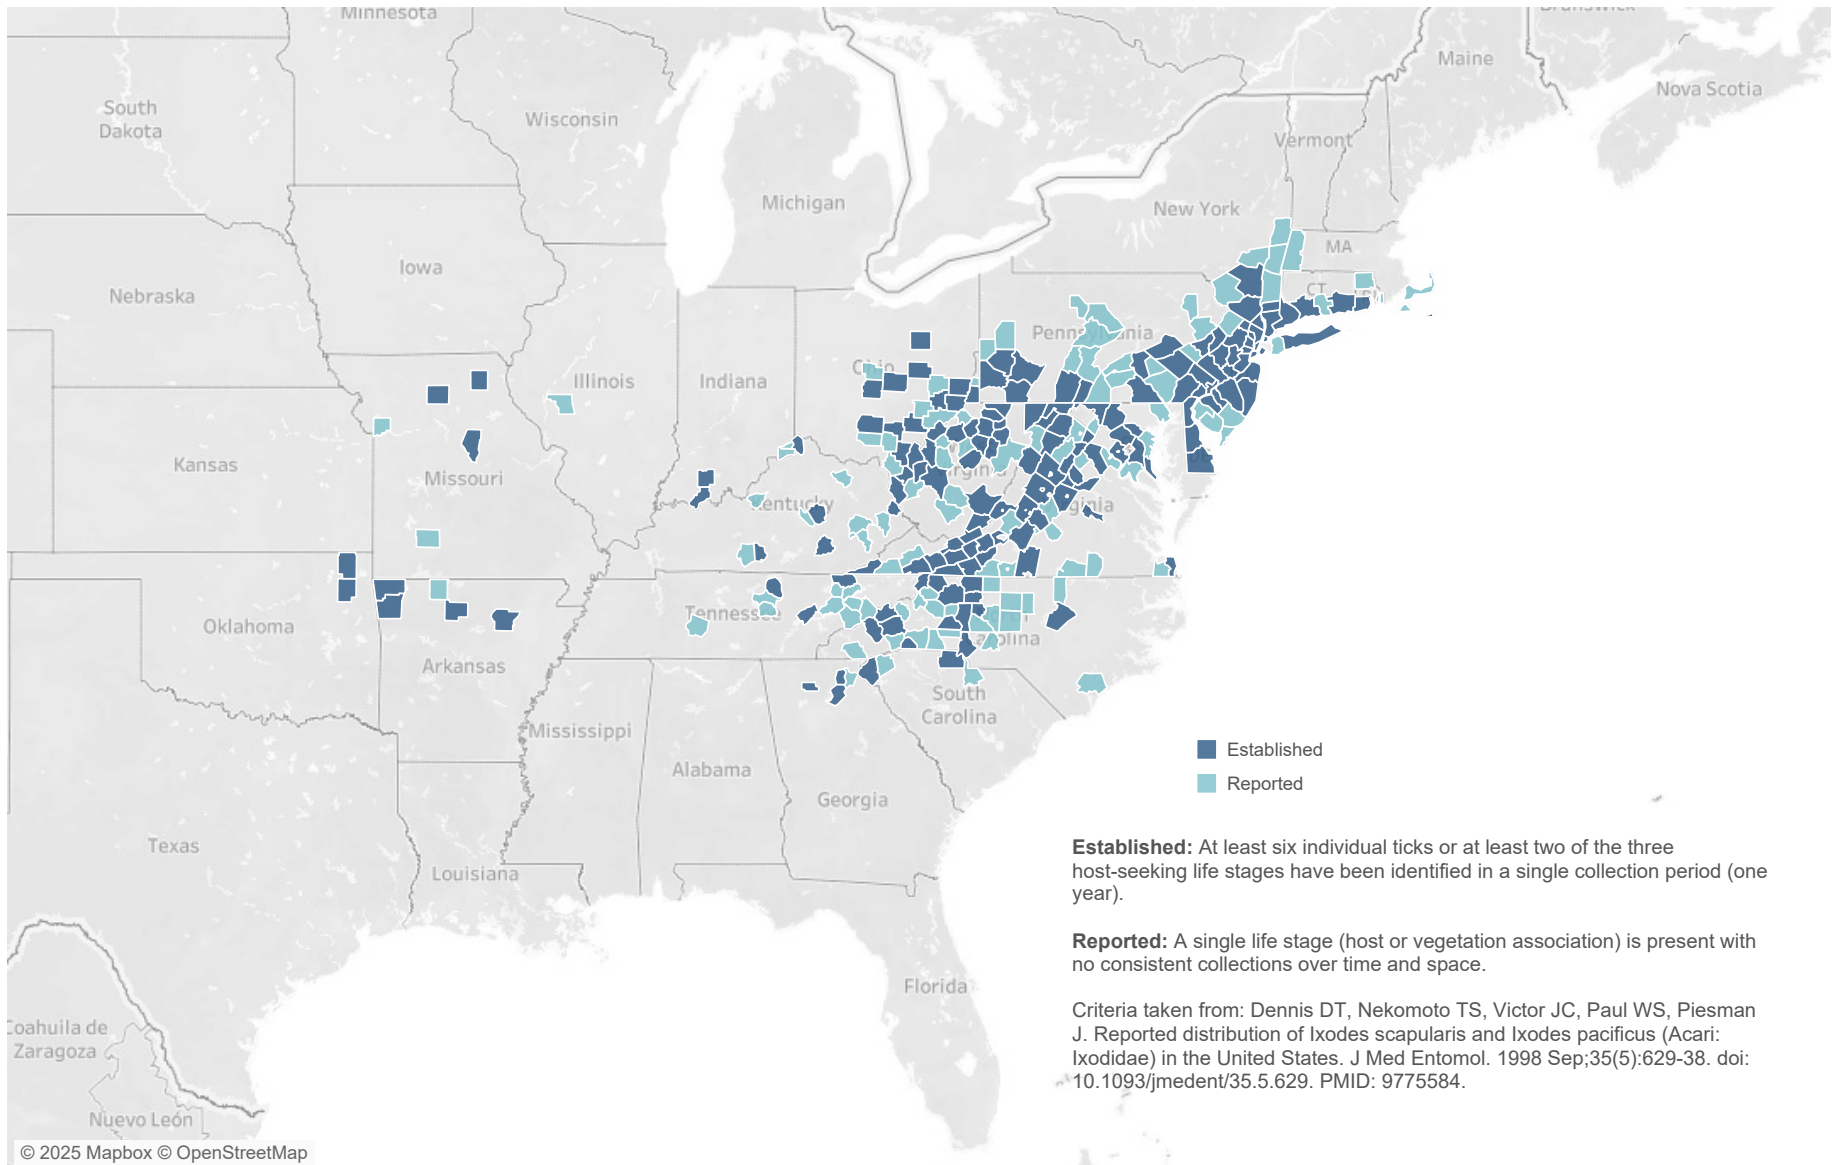

■ Molecular and NVSL    
 ■ NVSL    
 ■ Molecular    
 ■ Taxonomic

\* *H. longicornis* identification: NVSL= USDA, National Veterinary Services Laboratories. NVSL performs taxonomic identifications and is the preferred lab for confirmation of new states, counties, and hosts. Molecular= Confirmation of tick species by polymerase chain reaction (PCR) or other DNA-based technology. Taxonomic= Identification by key tick features at a lab other than NVSL.

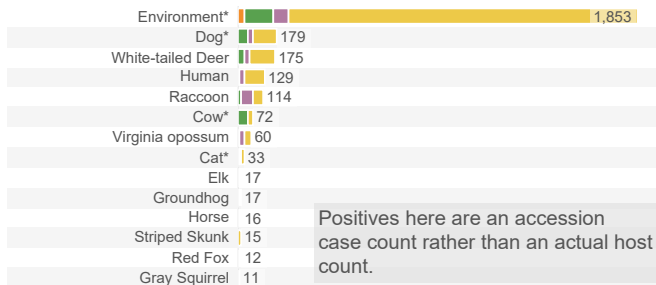

These data, and all the information contained therein, have been collected by the U.S. Department of Agriculture's Animal and Plant Health Inspection Service (APHIS), or by its cooperators on APHIS' behalf, for restricted government purposes only. This information is the sole property of APHIS. See full disclaimer here: [aphis.usda.gov/help/map-disclaimer](https://aphis.usda.gov/help/map-disclaimer).

## Counties with established Asian longhorned tick populations

# Asian longhorned tick positive hosts information

## Number of positive hosts

Positives here are an accession case count rather than an actual host count.

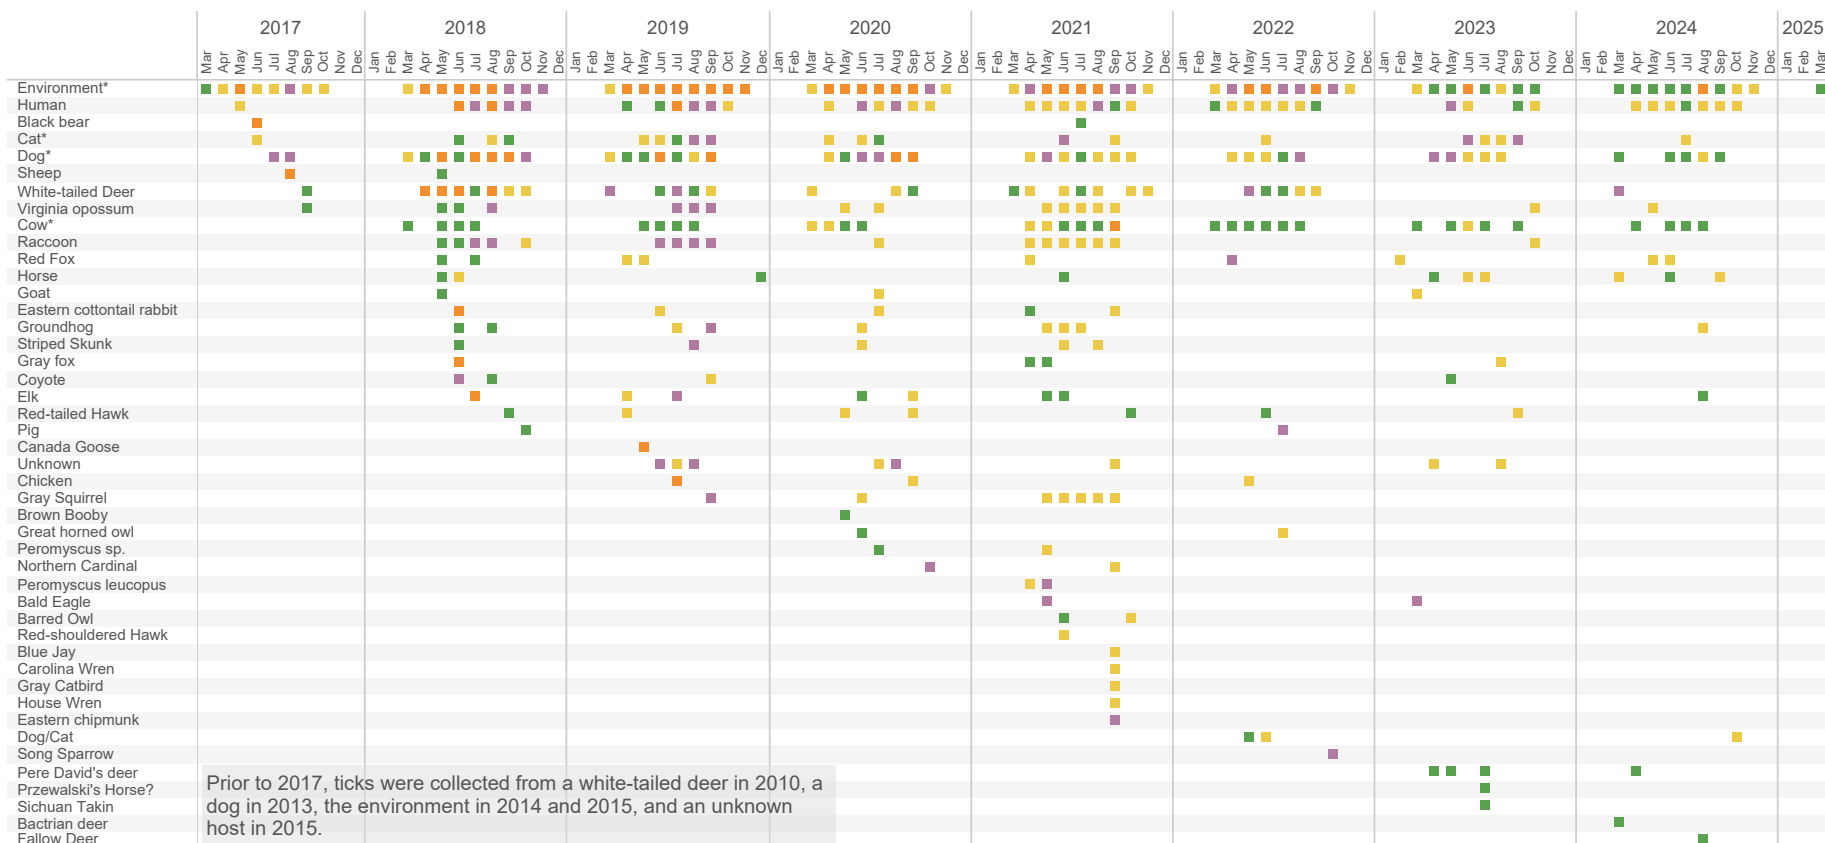

Type of identification (single) - Not aggregated  
■ Molecular and NVSL ■ NVSL

■ Molecular ■ Taxonomic

Gray Catbird	9	Bald eagle	2	Bactrian deer	1
Red-tailed hawk	9	Barred Owl	2	Blue Jay	1
Unknown	9	Black Bear	2	Brown Booby	1
Eastern cottontail rabbit	7	Eastern chipmunk	2	Canada Goose	1
Coyote	5	Northern Cardinal	2	Carolina Wren	1
Dog/Cat	5	Peromyscus leucopus	2	Fallow Deer	1
Gray Fox	5	Peromyscus sp.	2	House Wren	1
Pere David's deer	4	Pig	2	Przewalski's Horse?	1
Sheep	4			Red-shouldered Hawk	1
Chicken	3			Sichuan Takin	1
Goat	3			Song Sparrow	1
Great horned owl	3				

## Timeline of Asian longhorned tick host positives

\* Confirmed since last situation report.

Prior to 2017, ticks were collected from a white-tailed deer in 2010, a dog in 2013, the environment in 2014 and 2015, and an unknown host in 2015.

These data, and all the information contained therein, have been collected by the U.S. Department of Agriculture's Animal and Plant Health Inspection Service (APHIS), or by its cooperators on APHIS' behalf, for restricted government purposes only. This information is the sole property of APHIS. See full disclaimer here: [aphis.usda.gov/help/imap-disclaimer](https://aphis.usda.gov/help/imap-disclaimer).

## First date of Asian longhorned tick detections by state, county, and host

Earliest collected	Earliest confirmed	State	County	Host
